

## FU BAPI\_FAGL\_PLANNING\_POST

---

### Short Text

BAPI for Transferring Plan Data to New General Ledger Accounting

### Functionality

You can use this method to transfer plan data from an external data source to new General Ledger Accounting. You can also use the method to perform mass uploads of plan data. Plan data is transferred for each **ledger** for a **version**, a **company code**, a fiscal year, or for one or more periods of a fiscal year. You can specify that additional criteria are applied.

### Notes

Only amounts in the company code currency are transferred. If you use parallel local currencies for the company code in the corresponding ledger, the method translates the amounts that were provided in the company code currency into the parallel local currencies.

You can use the Business Add-In **Additional Validation of Plan Data** to make customer-specific additional settings for this method.

### Parameters

HEADERINFO

DELTA

TESTRUN

FIELDLIST

PERVALUE

EXTENSIONIN

RETURN

### Customer Enhancements

The BAPI customer enhancement concept enables you to consider additional data that was not considered at the interface.

The parameter EXTENSIONIN serves as a data container that is used to transfer the additional values during the import.

In addition to the extension parameters at the interface, you can use the Business Add-In (BAI) **Additional Validation of Plan Data** to check the additional data that is transferred to the method as well as to perform further processing of that data.

### Backflushes

Messages are returned in parameter RETURN. For more information, see the parameter documentation.
