

Assignment of Objects, Values and Control Data

Description

The IDX_STRUCTURE table assigns the contents of the individual tables to one another. In each row there must be an object that exists in the OBJECT_INDEX field.

You can also choose to transfer a row with periodic values from the PER_VALUE table or with annual values from the TOT_VALUE table and a row with control data.

The VALUE_INDEX field refers to the values. The ATTRIB_INDEX field refers to the control data.

If one of the two is not transferred, the field is set to zero.

Value range

The OBJECT_INDEX field may only contain values contained in the OBJECT_INDEX field of the OBJECT transfer table.

The VALUE_INDEX field may only contain values that are contained in the VALUE_INDEX field of either the PER_VALUE or TOT_VALUE transfer tables.

The ATTRIB_INDEX field may only contain values contained in the ATTRIB_INDEX field of the CONTRL transfer table.
