

Header Data

Description

This table contains the header data of the Enjoy purchase order (e.g. purchasing organization, vendor, currency, terms of payment).

The **item numbering** can be influenced via the field Item_Intvl. This can be done in one of three ways:

1. Adopt item numbering from Customizing for document type:

Populate the field Item_Intvl in the structure PoHeader. The X is not to be set for Item_Intvl in the X structure PoHeaderX. The item number must be set in the item tables. The numbering defined in Customizing overwrites the number defined in the item.

2. Do not adopt item numbering from Customizing for the document type:

Here the field Item_Intvl must be set at header level in the tables PoHeader and PoHeaderX. In addition, the item tables must contain a unique number viz à viz each other. The numbering defined in the header is then transferred to the items.

3. Predefine item numbering arbitrarily (externally):

The field PoHeader-Item_Intvl in the header must be left empty, but the X structure PoHeaderX-Item_Intvl must be populated with 'X'.

For more information on the individual parameter fields, see the data element documentation in the ABAP Dictionary.
