

## FU BAPI\_TRANSACTION\_COMMIT

---

### Short Text

Execute external Commit when using BAPIs

### Functionality

This method executes a COMMIT WORK command. It is required for transactions developed outside the SAP system that change data in the SAP system by using BAPI calls.

When you call BAPIs in your program that change data in the SAP system, you must then call this method to write the changes to the database.

### Notes

Messages are returned in the parameter 'Return'. The documentation for this parameter contains the return values and their meanings.

### Further information

Use the method BapiService.TransactionRollback to prevent changes to the database being committed.

### Parameters

WAIT  
RETURN

### Exceptions

### Function Group
