Produce Total of Existing and New Values

Description

If you set this indicator, the plan data to be transferred is added to the existing plan data in the database. In this way, the plan data to be transferred is applied as delta data.

Value range

- The indicator is not set (" ")

  The data to be transferred is applied as target values. Applying the delta update logic, the method transfers the differences between the existing plan data and the target values to the database.

- The indicator is set ("X")

  The data to be transferred is applied as delta data. The method adds the delta data to the existing plan data in the database.

Default

With the default setting, the indicator is **not** set, which means that the plan data to be transferred is applied as target values. The method reads the existing plan data using the criteria specified in the structures **HEADERINFO** and **FIELDLIST** and compares the data with the target values from structure **PERVALUE**.

The method writes the differences between the existing plan data and the plan data to be transferred to the database.
